

MortellaroVet ProBiotic 10 Liters | 10 I

Additive for hoof baths based on fermented herbs

Product number	498
Weight	10.1kg
Length	235mm
Width	180mm
Height	310mm

Product description

MortellaroVet Probiotic is designed for the care and hygienic reduction of rot-prone claw problems such as Mortellaro. Mortellaro and other problems caused by rot are favoured by unhealthy rotting stable flora. MortellaroVet ProBiotic strengthens the aerobic germinal flora, which naturally hinders or suppresses rot. The claws are thus given an environment by the claw bath which reduces or helps to avoid care and hygiene-related causes of stress. Rot germs or germs of disease can generally be displaced by a healthy stable and skin flora. Mortellaro in cows: Mortellaro in cows in free range barns is often a massive health and therefore soon a financial problem for the owner. What are the main causes? 1. moisture in the barn causes rotting manure and slurry. The manure rots anaerobically and is an ideal soil for rotting germs, which can become a problem especially with damp and soaked skin areas. 2. metabolic overload in cows also causes cows to try to detoxify via the skin. This results in cheese-like secretions. These secretions are an ideal breeding ground for putrefactive bacteria. If the affected skin areas are not sufficiently cared for, inflammation can quickly develop and spread like an epidemic in the barn. Causes of such occurrences are therefore primarily lack of care, incorrect nutrition and husbandry conditions. How can cdVet help: 1. Nursing with claw gel. Claw gel binds moisture and forms an oxygen permeable plaster, which dries the skin and the skin for healthy body regeneration massively relieves and at the same time avoids the new contamination of the skin areas. Claw gel is therefore a product for individual animal care that has been indispensable in the field of claws for more than 14 years. 2. mortellaroVet ProBiotic is a further development based on fermented herbs which have a massive germ displacing effect and thus form a natural competition to harmful germs. The product is almost identical to cdSept and is already used for this purpose in dairy cattle sheds. Experience has shown that its use in the hoof bath is helpful for a healthy hoof and stable flora. It is important to make sure that there are no residues of chemical preparations in the claw bath, otherwise the effect of MortellaroVet ProBiotic is limited. It is therefore recommended to use it in a new hoof bath. The otherwise typical problem of soiling through faeces in hoof baths is rather unproblematic when using MortellaroVet ProBiotic. By using MortellaroVet ProBiotic, the organic matter in the hoof bath becomes a medium for healthy germs and is thus able to displace the existing harmful germs. For the treatment of the running surfaces HuminoVet powder should be scattered occasionally. HuminoVet initiates the natural composting process, which helps to avoid floating layers in the liquid manure and at the same time massively displaces decaying and therefore pathogenic germs as well as Mortellaro-promoting decay germs. Due to nutritional factors the metabolism can be intensively relieved by MicroAgrar MK. The economic efficiency of MicroAgrar MK is already given by the promotion of feed conversion and thus basic feed utilization. In summary: Claw gel: for individual animal care MortellaroVet ProBiotic (from EuroTier 2012)(almost identical to cdSept): for the hoof bath HuminoVet Powder: for the treatment of

damp rot areas in the stable to displace Mortellaro breeding sites) (simultaneously effective manure improver)
 Important: Do not use any aids (syringes, watering cans, sprayers, etc.) in which chemical disinfectants have already been used. These can destroy or reduce the effect of MortellaroVet ProBiotic.

Product properties

Phase of life	Seniors, Adults, Juniors
Feed Profile	Probiotic, Oils & essential fatty acids, Without additives
Animal categories	Cows
Product type	Care & hygiene
Product form	Liquid
Special Requirements	Mortellaro
